

WHAT IS CLAIMED IS

5

1. A nonvolatile semiconductor memory device, comprising:
a plurality of blocks each having a memory cell array;
10 a reference cell;
a signal line that supplies a reference signal read from said reference cell to each of said plurality of blocks;
a reference load circuit which is provided
15 in each of said plurality of blocks, and imposes a load on the reference signal that is identical to a load imposed on data that is read from said memory cell array; and
a sensing circuit which is provided in
20 each of said plurality of blocks, and compares the data with the reference signal having the load imposed thereon by said reference load circuit so as to sense the data.

25

2. The nonvolatile semiconductor memory device as claimed in claim 1, wherein said reference load circuit includes a pass gate that allows the reference signal to go therethrough only in one of the blocks that is selected.
30

35

3. The nonvolatile semiconductor memory

device as claimed in claim 2, further comprising a Y
gate which is provided in each of said plurality of
blocks, and selects the data read from said memory
cell array, wherein a gate at a last stage of said Y
5 gate and said pass gate are structurally identical
as circuit elements, and are driven by the same
potential.

10

4. The nonvolatile semiconductor memory
device as claimed in claim 3, further comprising a
gate that allows the reference signal to go
15 therethrough, and corresponds to a gate other than
that of the last stage of said Y gate, said gate
being provided in common for each of said plurality
of blocks and provided in the vicinity of said
reference cell.

20

5. The nonvolatile semiconductor memory
25 device as claimed in claim 3, further comprising:
 a boosting circuit which generates a
boosted potential that drives the gate at the last
stage of said Y gate and said pass gate;
 a power supply line which supplies the
30 boosted potential generated by said boosting circuit
to each of said plurality of blocks; and
 a switch circuit which is provided in each
of said plurality of blocks, and supplies the
boosted potential to the gate at the last stage of
35 said Y gate and said pass gate only in said one of
the blocks that is selected.

6. The nonvolatile semiconductor memory
5 device as claimed in claim 1, wherein said sensing
circuit includes a first current-to-voltage
conversion circuit which converts a current to a
voltage with respect to the data, and said reference
load circuit includes a second current-to-voltage
10 conversion circuit which converts a current to a
voltage with respect to the reference signal,
wherein said first current-to-voltage conversion
circuit and said second current-to-voltage
conversion circuit have an identical circuit
15 structure.

20 7. The nonvolatile semiconductor memory
device as claimed in claim 1, wherein said sensing
circuit includes a first grounding circuit which
couples a source potential with respect to the data
to a ground, and said reference load circuit
25 includes a second grounding circuit which couples a
source potential with respect to the reference
signal to the ground, wherein said first grounding
circuit and said second grounding circuit have an
identical circuit structure.

30

8. The nonvolatile semiconductor memory
35 device as claimed in claim 7, wherein said sensing
circuit further includes a circuit which short-
circuits the source potential with respect to the

data to the source potential with respect to the reference signal.

5

9. The nonvolatile semiconductor memory device as claimed in claim 1, wherein said sensing circuit includes a first precharge circuit which
10 precharges a potential of a bit line adjacent to a drain bit line with respect to the data, and said reference load circuit includes a second precharge circuit which precharges a potential of a bit line adjacent to a drain bit line with respect to the
15 reference signal, wherein said first precharge circuit and said second precharge circuit have an identical circuit structure.

20

10. The nonvolatile semiconductor memory device as claimed in claim 9, wherein said sensing circuit further includes a circuit which short-circuits the potential of the bit line adjacent to the drain bit line with respect to the data to the potential of the bit line adjacent to the drain bit line with respect to the reference signal.
